

VOXARIS AI

Personalizing Your Outreach

GVR Pilot -- Call Summary & Next Steps

Government Vacation Rewards | Voxaris x Arrivia

DATE	May 6, 2026
FROM	Ethan Stopperich, Voxaris
TO	Chris Cole, Jay Bankhead, Russell Reese, Stacey Sutherland -- Arrivia
RE	Andie -- AI Fronter Agent, GVR Pilot

Based on our April 30 discovery call. Numbers confirmed by team -- please flag anything off.

WHAT WE'RE BUILDING

Andie is a voice AI agent that handles the fronter role for GVR's cold and warm propensity base -- the same job your Philippines team does today, but consistent, scalable, and available whenever you want to dial.

The job is intentionally narrow: confirm who the member is, remind them they have active benefits, get a read on their travel intent, and hand them to a closer with that context already loaded in. That's it. No pricing, no heavy qualification, no selling.

Everything else -- the scripting, the cadencing, the segmentation -- we match to how Jay's best frontiers already work. The goal for the pilot is to prove this out on GVR first, then roll it to iCruise, Smarter Getaways, and the rest of the brands.

NUMBERS WE CONFIRMED

Metric	What you told us
Total fronter agents	23 total (14 active, 9 recently hired -- some only 4 days in)
Revenue per fronter / month	~\$19,000 (full month, includes new hires)
Total fronter revenue / month	~\$400,000-\$450,000
Daily dials (HCI through LiveVox)	~30,000
Connect rate	~10% (~3,000 connects/day)
Daily transfers to closer	150-200 (177 Thu, 181 Fri last week)
Fronter work schedule	Monday-Friday, mirrors the sales team
Best contact hours	Nights and weekends
Lead cadence	6 attempts per quarter, ~7 campaigns in rotation
Inbound lift from outbound	50% of all inbound calls are people calling back after being touched by the outbound dialer -- voicemails, hang-ups, missed calls that generated a return. Example: if Arrivia receives 10,000 inbound calls in a week, ~5,000 of those originated from the outbound footprint.
Inbound callbacks / week (exact)	TBD -- Russell to confirm the actual weekly inbound volume so we can size this properly.
Lead pool for this pilot	Free membership base -- cold/warm propensity, not the hot daily enrollments

The hot leads (same-day enrollments, recent bookers) stay with Jay's outbound sales reps -- those convert too well to mix into this program. We're focused on the large cold/warm base.

HOW THE CALL WORKS

Based on the call and the fronter transcripts Chris shared, here's how we're building Andie's flow:

Recording disclosure	Within the first 10-15 seconds, every time, no exceptions.
Credibility check	Andie references the member's name, enrollment date, and email on file. Simple stuff that proves the call is legitimate and they actually signed up.
Light discovery	One or two questions about travel plans -- where they're thinking of going, when, who's coming. Nothing heavy.
Warm handoff	Andie transfers to a closer with a quick summary of what she learned. The closer gets that context the moment the call connects.

No pricing gets discussed on the fronter call -- same as today. That stays with the closer.

LEAD DATA -- WHAT WE PULL FROM LIVEVOX

These are the fields that actually matter for personalizing the outreach. All of this should already be in LiveVox. Russell, flag anything that's missing or named differently in your system.

Field	How Andie uses it
First name	Personalizes the opener
Enrollment date	Credibility -- 'you signed up back in March of 2023'
Email on file	Credibility -- confirms the call is legitimate
Lead source / brand	GVR vs. other Arrivia brands; campaign routing
Campaign / attempt number	Different tone for a 1st attempt vs. a 5th
Last disposition	Avoids repeating whatever didn't work last time
State / area code	Local presence number matching
Time zone	Makes sure we're not calling outside TCPA windows
TCPA consent flag	Hard gate -- no flag, no call
DNC / litigator flag	Hard suppression
Booking history	If they've actually traveled with GVR, that's a great opener

Per the call -- we're keeping it to what members already gave you at signup. No address, no DOB, no payment info, nothing that would make an outbound call feel creepy. Just enough to show we know who they are.

WHAT ANDIE SENDS BACK AFTER EVERY CALL

After each call wraps, we push a record back into LiveVox so the disposition, transcript, and discovery notes are all in the same place your team already works.

Field	What it contains
Outcome	transferred / declined / voicemail / no-answer / callback-requested / wrong-number
Transfer success	did the warm handoff actually connect
Closer transferred to	name or extension
What member confirmed	name, email match, travel intent
Objections raised	structured list for Jay's team to review
Call duration	fronter leg only
Recording disclosure	boolean -- compliance audit trail
Transcript link	full text of the conversation
Recording link	audio
Callback requested	boolean + requested time if applicable

THE TECHNOLOGY PICTURE

LiveVox integration (Russell)

LiveVox is where everything lives -- the lead list, the recordings, the dispositions. The simplest starting point is a daily batch file that LiveVox exports and we pull in. We can upgrade to real-time API once we've validated the setup. We just need read access for the list and write access to post outcomes back.

Caller ID (Russell)

You're already looking at branded LCIDs (~\$1k/month for a couple numbers) and rotating local presence numbers (602, 480, 407, etc.). That's exactly the right approach. We've seen branded ID lift connect rates meaningfully, especially with iOS screening. We'll match whatever number pool you give us.

Warm transfer (Jay)

When Andie is ready to hand off, she bridges the call to a closer and passes a summary of what she learned. The closer gets that context the moment they pick up -- no need for the member to repeat themselves. We'll connect to whatever endpoint you're using (SIP, PSTN, or LiveVox internal).

TCPA compliance

Recording disclosure in the first 10 seconds, state-by-state consent handling, litigator list suppression, DNC scrubbing. We build all of that in from day one. We'll need the approved disclosure language from your legal team to make sure we're saying it exactly right.

iOS call screening -- the elephant in the room

iOS 17 and iOS 18 introduced aggressive call-screening behavior that has reduced outbound connect rates across the industry by roughly 30%. This is the single biggest threat to any AI dialer program, and we're treating it as a first-class problem -- not a footnote.

How we're attacking it on the Andie pilot:

- **Branded Caller ID (RCD).** Pilot the LCIDs Russell is already evaluating (~\$1k/month for a couple of numbers) so the recipient sees 'Government Vacation Rewards' instead of an unknown 10-digit string. Biggest single lift.
- **STIR/SHAKEN A-attestation.** Verify your Twilio trunk is ship A-attested (not B/C). Carriers route A-attested numbers through fewer screening filters. Russell to confirm current attestation level on the GVR trunk.
- **Local-presence number rotation.** Match the recipient's area code (602, 480, 407, etc.). You're already doing this -- we'll match whatever pool you rotate through, and we'll add carrier-level reputation monitoring so we can retire numbers before they get spam-flagged.
- **Voice that sounds human.** Andie's voice is tuned for PSTN audio compression with natural pacing. iOS screening models trained on DTMF-style robocall audio typically pass through natural-cadence voices.
- **Voicemail drop fallback.** If a call hits voicemail, Andie leaves a personalized message rather than dead-air -- which generates inbound callbacks that bypass the screening problem entirely (Chris's 50% inbound lift stat).

VOICE SELECTION

Given GVR's demographic (US military, veterans, federal civilians), we're defaulting to clearly American-English voices with natural cadence. Below are five candidates Jay and the team can A/B on the test line -- three female, two male. Voice 1 is current production.

Voice	Description	Gender
Voice 1 (current)	Confident, young American adult female. Mid-American accent, warm-but-professional, natural breath cadence. Currently in production on the test line.	Female
Voice 2	Mature American female, slightly lower register than Voice 1. Reads as more experienced -- 'rep who's been doing this 10 years'. Good for older-skewing GVR cohort.	Female
Voice 3	Mid-American female, lighter register, slight upbeat. Was the original Andie voice before the recent swap. Kept as a production fallback.	Female
Voice 4	Energetic American adult male. Higher energy than the female options -- worth A/B-ing on younger military demographic and follow-up calls.	Male

Voice	Description	Gender
Voice 5	Calm American male, lower register, professional cadence. Good if the team prefers a 'senior account manager' feel over an upbeat fronter.	Male

Jay and team -- call the test line (number you already have) for each voice you want to hear. Tell us which one converts best in your gut, and we'll lock it in before pilot go-live. We can swap the voice any time, even mid-pilot, in 60 seconds.

DASHBOARD

The dashboard is already live and accessible to your team right now -- no separate link will be sent, you can use the details below directly:

URL	https://arrivia.voxaris.io/dashboard
Username	arrivia
Password (interim)	demo2026
Recommended access	Bookmark the URL above. Each stakeholder can use the shared login during the intake/sandbox period; per-user credentials will replace this before pilot go-live (June 1).
Per-user credentials	Provisioned by May 22, 2026 -- four named accounts for Chris Cole, Jay Bankhead, Russell Reese, and Stacey Sutherland. Voxaris will email each stakeholder a password reset link the day they're created.

Right now the dashboard shows calls answered, engagement past intro, warm handoffs, top objections, and the outbound dial trigger. The KPI view will be built out to match what Jay and Chris actually care about. Working list:

- Connect-completion rate vs. Philippines baseline (~5.9% transfers/connects)
- Transfer rate (% of connects that become warm handoffs)
- Revenue attributed to Andie-sourced transfers
- Top objections (auto-categorized from transcripts)
- Inbound callback lift (50% of your inbound today traces to outbound -- let's track if that moves)
- Cost per transfer running total

Chris, Jay -- tell us what's missing and we'll add it.

WHAT WE NEED FROM YOU

Short list, no drama. Just the things we can't build without:

What	Who	Why we need it
1,000 successful fronter transcripts	Jay	We model Andie's flow on your best fronters. Jay mentioned he can pull these.
1,000 unsuccessful transcripts	Jay	Equally useful -- knowing what didn't work is half the job.
LiveVox API access or test environment	Russell	List in, dispositions out. Sandbox first so we don't touch production.
Approved recording disclosure language	Arrivia legal	We're already disclosing in the first 10s -- just need the exact approved wording.
Closer transfer endpoint	Jay	SIP, PSTN, or LiveVox internal -- wherever you want Andie to bridge the call.
Lead field mapping from LiveVox	Russell	The column names in your LiveVox export so we map them correctly.
Voice selection	Jay + team	Call the test line, pick a voice, and let us know.
Forbidden phrases / claims	Jay + legal	Anything you don't want Andie saying. Pricing, comparisons, competitor names, etc.

That's it. Everything else we figure out as we go. The goal is to have Andie running on a sandbox call list within two weeks of the SOW signing.

-- Ethan Stopperich, Voxaris
